Alexey

Python Backend Developer

Bălți, Moldova | Remote
github.com/Middlewarer

Python backend developer working on REST APIs, service integrations, PostgreSQL and background processing. Own features from requirements and design through implementation, release and production support.

Technical skills

Languages: Python; JavaScript for React interfaces.
Backend: Django, Django REST Framework, FastAPI, asyncio, Pydantic.
Data: PostgreSQL, SQL, Django ORM, SQLAlchemy, Redis.
Integrations: REST APIs, HTTP, JWT, Celery, RabbitMQ.
Testing: pytest, unit and integration tests, mocking external services.
Infrastructure: Git, Linux, Docker, Docker Compose, GitHub Actions, CI/CD.

Experience

Python Backend Developer | B2B SaaS Company

September 2023 - September 2026 | 3 years

A platform with user accounts, access management and external integrations. Responsible for backend features, service integrations and support for released functionality.

Responsibilities

- Designed and developed APIs with **Django/DRF and FastAPI**, including data models, Pydantic validation, authorization and asynchronous requests to external services.
- Worked with **PostgreSQL and Redis** on SQL queries, indexing, transactions, schema migrations, caching and cache invalidation.
- Clarified requirements, estimated tasks and participated in code reviews. Investigated failures through logs, added regression tests and documented API behavior.

Selected results

- Removed N+1 queries and tuned indexes using EXPLAIN ANALYZE. Reduced SQL queries per catalog request **from 74 to 11** and p95 latency **from 920 to 240 ms** with the same dataset and load.
- Implemented background processing with **Celery/RabbitMQ**, retries, timeouts and error handling. Prevented duplicate webhook processing using transactions and unique keys.
- Reached **87% line coverage of application backend code** with pytest. Tested access permissions, duplicate requests, timeouts and invalid external API responses.
- Automated builds and releases with **Docker and GitHub Actions**, including tests, migrations and health checks. Cut release time **from 40 to 10 minutes**.

Experience: technical scope

Python Backend Developer | B2B SaaS Company

Integrations and background processing

- Moved long-running operations from API handlers into Celery tasks. Stored task state in PostgreSQL so clients could retrieve processing status and results through a separate endpoint.
- Configured timeouts and bounded retries. Distinguished transient service failures from invalid input that would not benefit from another attempt.
- Stored external event identifiers and processing status. Applied access changes and recorded their outcome within the same database transaction.

Data and backward compatibility

- Maintained database schemas through migrations. Separated new fields, batched data backfills and removal of obsolete fields to preserve compatibility with the running application.
- Reviewed transaction boundaries and uniqueness constraints for concurrent requests. Used query execution plans to investigate performance alongside API response times.
- Documented request formats, error codes and contract changes. Coordinated API updates with frontend changes before release.

Testing and release support

- Wrote unit tests for business logic and integration tests against PostgreSQL. Simulated network failures, timeouts, duplicate events and invalid JSON from external APIs.
- Investigated failures using API and worker logs. Added regression checks and updated documentation after fixes; verified migrations and service health after releases.

Education

Kostroma State University
Information Systems and Technologies | Bachelor's degree in progress, third year

Personal project

EidosAcademy. A learning platform built with Django/DRF, PostgreSQL and React. Implemented APIs, authentication and progress tracking; configured tests, CI and deployment.
