Alexey

Python Backend Developer

Bălți, Moldova | Remote
github.com/Middlewarer

Python developer with 3 years of experience. Independently developed and maintained an internal lead-management system for a jewelry design company. Main stack: Django, Django REST Framework and PostgreSQL. Worked on APIs, integrations, background tasks and releases.

Technical skills

Backend: Python, Django, Django REST Framework, FastAPI, REST API, HTTP, JWT.
Data: PostgreSQL, SQL, Django ORM, Redis.
Background tasks: Celery, RabbitMQ.
Testing: pytest, unit and integration tests, mocking external APIs.
Tools: Git, Linux, Docker, Docker Compose, GitHub Actions.
Additional: JavaScript and React for interface development.

Experience

Python Backend Developer | Jewelry Company

September 2023 - September 2026 | 3 years

An internal system for tracking leads and customer inquiries. Handled development independently: clarified business needs, updated the backend, tested changes and maintained the application after releases.

Selected results

- Reduced SQL queries per catalog request **from 74 to 11** and p95 latency **from 920 to 240 ms** under the same load and dataset. Removed N+1 queries and tuned indexes using EXPLAIN ANALYZE.
- Reached **87% line coverage** of application backend code with pytest. Added tests for access permissions, duplicate requests and external API failures.
- Cut typical release time **from 40 to 10 minutes** by automating builds and releases with Docker and GitHub Actions, including tests, migrations and health checks.

Main responsibilities

- Developed Django/DRF REST APIs to create and update leads, store contact details and change inquiry statuses. Added validation, search, filtering and pagination.
- Worked with Django ORM models and PostgreSQL: updated schemas through migrations, wrote SQL queries and reviewed data retrieval. Used Redis for caching.
- Integrated external APIs to exchange inquiry data. Maintained individual FastAPI endpoints and Celery background tasks with error handling, timeouts and retries.
- Independently tested and released changes: wrote tests, used Docker and GitHub Actions, applied migrations, investigated errors through logs and updated documentation.

Experience: task details

Python Backend Developer | Jewelry Company
September 2023 - September 2026 | 3 years

Leads, inquiries and data

- Developed APIs for lead records containing contact details, customer inquiry information and processing status. Validated input and checked permissions when reading or updating records.
- Updated search and filters for inquiry lists. Changed models and relationships through migrations, reviewed Django ORM queries and removed unnecessary PostgreSQL calls.
- Used Redis to cache frequently requested data, configured expiration times and refreshed cached data after changes. Documented API request and response formats.

Integrations and background tasks

- Maintained incoming and outgoing inquiry data exchange through external APIs. Checked HTTP status codes and response formats, handled timeouts and logged errors.
- Moved long-running processing to Celery with RabbitMQ. Configured bounded retries for temporary failures and stored processing status for checking through the API.
- Checked webhook event identifiers to prevent repeated delivery from creating duplicate records. Used transactions and uniqueness constraints.

Independent development and support

- Clarified required changes to inquiry workflows, broke updates into small tasks and checked the relevant scenario before release. Managed code in Git and documented changes.
- Wrote API and business-logic tests with pytest and mocked external responses. Checked builds and tests in CI, reviewed logs after deployment and fixed reported errors.

Education

Kostroma State University
Information Systems and Technologies | Bachelor's degree in progress, third year
